PROFILE

Senior Android Engineer with strong expertise in Jetpack Compose, Kotlin, and highly scalable native Android architectures. Proven track record of delivering high-performance, resilient streaming and gaming experiences for millions of active users across Mobile, Android TV, and Fire TV. Specialized in custom video playback pipelines, complex focus management, performance optimization on low-end devices, UI/UX responsiveness, and maintaining ultra-high session stability (99%+ crash-free). Dedicated to architectural excellence, modularization, and clean code standards.

PROFESSIONAL EXPERIENCE

Novibet, São Paulo • Android Engineer (Casino & Sportsbook)

(06/2026) - Present

- Developed and scaled native Android features for a high-traffic gaming platform using Kotlin, Jetpack Compose, Coroutines, Flow, and Clean Architecture, across live casino and real-time sports betting experiences.
- Drove Android modernization initiatives by migrating XML-based UIs to Jetpack Compose and incrementally replacing RxJava with Kotlin Coroutines and Flow, improving maintainability, state management, and asynchronous execution.
- Designed and implemented third-party provider integrations, including APIs and WebView-based experiences, handling native-to-web communication, authentication/session flows, navigation, error handling, and provider-specific requirements.
- Built and optimized real-time, data-driven UIs, including live game feeds and sports content, focusing on efficient state/list management, rendering performance, responsiveness, and low-latency user interactions.

Global Hitss, São Paulo • Specialist Android Engineer (TV Streaming APP)

(12/2024) - (03/2026)

- Drove development of large-scale native streaming applications for Android Mobile, Android TV, and Fire TV using Kotlin and Jetpack Compose, supporting over 1 million active users.
- Architected and implemented complex Compose-based UI systems for TV platforms, including custom focus management, animated transitions, and remote-navigation optimisations.
- Built reusable Compose components and scalable UI abstractions shared across multiple features, improving development velocity and interface consistency.
- Developed features in both fully Compose-native and hybrid View/Compose environments, integrating Compose into existing Fragment- and Activity-based architectures.
- Led migration efforts from legacy XML-based UIs to Jetpack Compose, improving maintainability, reducing UI complexity, and modernising the application stack.
- Applied advanced Compose state-management patterns using StateFlow, Kotlin Coroutines, ViewModel, and unidirectional data flow principles.

- Optimised Compose rendering performance and recomposition behaviour for constrained devices such as Fire TV Stick and entry-level Android TVs.
- Designed and implemented a modular Android TV notification framework under Clean Architecture, abstracting timing, animation, and rendering logic into reusable components.
- Engineered custom video player interfaces and media playback pipelines supporting DRM-protected adaptive streaming and live events.
- Developed and maintained custom Bitmovin-based media players with platform-specific Compose controls and DRM-protected streaming support.
- Reduced crashes and ANRs to below 0.1% of sessions through proactive monitoring, performance analysis, and stability improvements using Firebase Crashlytics.
- Worked within MVVM + Clean Architecture ecosystems, applying SOLID principles and modularisation strategies to ensure scalable and testable applications.
- Collaborated closely with cross-functional teams through code reviews, technical discussions, and agile delivery processes.

Open Labs S.A., Sao Paulo • Android Engineer

(04/2021) - (01/2024)

- Developed and maintained native Android applications using Kotlin, applying modern development and modularisation practices to ensure scalable and maintainable code.
- Used Crashlytics to identify and resolve critical issues efficiently, ensuring application stability.
- Designed and implemented a prototype OTT client in React Native, independently creating UI components, navigation flows, API integration, and platform-specific adaptations.
- Led a team of engineers during the restructuring of parts of our streaming application, such as the favourites screen, live content player, and profiles section, which resulted in a significant increase in the app's score in the Play Store, from 3.0 to 4.7, in newer versions.
- Developed test scenarios to validate deliveries and ensure code quality, using JUnit and Mockito.
- Crafted designs with Figma as part of our efforts to redesign the UI of a streaming application

ACADEMIC HISTORY

University of Sao Paulo - USP

(02/2019) - (12/2022)

Bachelor's in Information Systems

- Learned about computer science concepts such as algorithms and data structures, software architecture, artificial intelligence, and data analysis, among others.
- Worked on scientific initiation and extension projects.

SKILLS

- **Programming Languages:** Java, Kotlin, Python
- **Frameworks:** Android SDK, Jetpack Compose, Kotlin Coroutines
- **Tools & Libraries:** Git, Android Studio, Bitmovin Player, ExoPlayer, DRM/Widevine, Firebase Crashlytics, Retrofit, OkHttp
- **Languages:** Portuguese(native), English(Advanced)
- **Architecture:** MVVM, Clean Architecture, Modularisation, SOLID
